target Q (8 Gaussians)

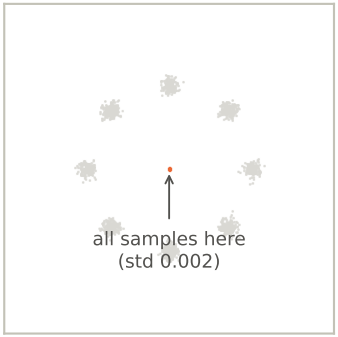

corrected, $\beta = 1$
$D_1 = 0.00983$

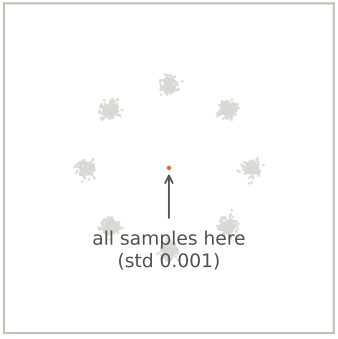

corrected, $\beta = 1.5$
$D_1 = 0.0159$

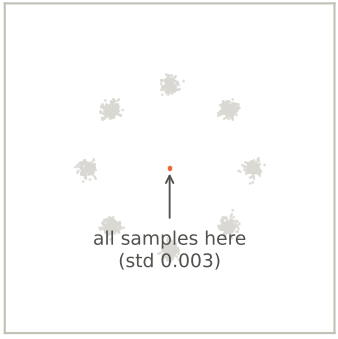

literal: $-\frac{1}{2}E[F(x) - F(x')]$
$D_1 = 1.46$

x, x' from data: $-\frac{1}{2}E\|y - y'\|$
$D_1 = 1.46$

squared norms ($\beta = 2$)
$D_1 = 1.46$

coefficient 1 instead of $\frac{1}{2}$
$D_1 = 2.41\text{e+}08$

$\|\cdot\|$ then $-\frac{1}{2}\|\cdot\|^2$
$D_1 = 9.65\text{e+}08$
